

At this stage all the suburbs in subsetValidSuburbs are exact matches (no fuzzy logic has been applied). There may have been more than one suburb supplied (one in API data and others as [extra text] in addressLine), however things not in the validState and/or validPostcode has been discarded. That's not to say that this routine is never guessing - ambiguity is still possible. If the address was "NOTTING HILL, CLAYTON, 3168" then both suburb will still be in the list, as both are in postcode 3168. This routine will choose one.
